AISI 431 SS

ANY SIZE – ANY TIME

Your specialist for AISI 431 sawn steel
from forged billets directly from stock in
Texas. We provide metal cutting services.

Why Choose Our Stainless Steel Rectangle Bar AISI 431? SS
431 is a martensitic chromium steel that is rust and acid resistant

**Applications
of 431 ss
material:**

AISI 431 is classified according to 1.4057 .

Due to its high strength, the main area of application for this stainless steel is mechanical engineering, as stainless thrust washers, turbine blades, spindles, pump parts, piston rods or in the petroleum and petrochemical industries. Other applications of martensitic steel AISI 431 SS are in power plant construction, the automotive industry and aviation.

Our expert knowledge about 431 stainless steel

Is AISI 431 a stainless steel?

AISI 431 is indeed classified as a stainless steel. It belongs to the martensitic stainless steel group, characterized by high strength, moderate corrosion resistance, and good toughness.

Is SS 431 magnetic?

Yes, SS 431 is magnetic. Martensitic stainless steels like AISI 431 are generally magnetic due to their microstructure, which consists primarily of ferrite and/or martensite phases.

Is 431 SS weldable?

431 SS can be welded, but it requires careful attention to welding procedures. Due to its high carbon content and alloying elements, AISI 431 is prone to cracking during welding if proper precautions are not taken. Preheating before welding and post-weld heat treatment are often necessary to minimize the risk of cracking and ensure satisfactory weld quality.

brittle scale after the heat treatment process. During quenching, the steel is rapidly cooled from high temperatures to room temperature to achieve a hardened microstructure.

Subsequently, tempering is performed to reduce brittleness and improve toughness while maintaining a desired level of hardness. The resulting material typically exhibits enhanced strength and toughness properties, suitable for various industrial applications.
